Abstract

The Amsterdam Troy Project aims to understand better the old excavations at ancient Troy. To this aim, the team from the University of Amsterdam studied the physical remains of the excavators at this canonical site: excavations were conducted in spoil heaps, in filled-in trenches and a 4D digital model of the site has been created. In this lecture, some of the results of this experimental project will be presented. More in general, the question will be raised to which extent archaeology is able to reflect on its methodologies by archaeological means.
